ASSIGNMENT:

We want to create an application that mimics the sandwich ordering system at Abis.

You will need 3 applications/projects:
1) a SandwichAPI, which manages the sandwiches you can find on the order list.
2) a Spring MVC frontend that uses the SandwichAPI, in which the AbisAdmin can add/remove sandwiches.
3) a SandwichOrderAPI, such that students/instructors can order sandwiches

Check out the application architecture design created by your instructor.
You can also use a basic skeleton project to set up the model, and to check out some requirements at
https://github.com/sschillebeeckx/sandwichskeleton

Feel free to change/improve the design if you want!

REQUIREMENTS:

1) SandwichAPI:
*Everybody can find sandwiches from the list (full list, by category, by name, ...)
*The AbisAdmin can add and remove new sandwich to the list, and update their price

2) SandwichFrontend:
*This is the Web frontend for the SandwichAPI.

3) SandwichOrderAPI:
*Students and instructors have to be able to order a sandwich. There is a max of 2 sandwiches per person.
*The AbisAdmin can print the order in a readable format, saved in a .txt file
*The AbisAdmin can calculate the total price of the order. This price should also be saved in the database.

Non-Functional:
*structure your application correctly
*make sure to have JUnit tests for all layers
*document your APIs
*provide exception handling
*use Spring Security to handle the roles of the persons
*use Git to manage your project; your instructor has to have access as well
*use an Oracle DB to persist your data (there should be 2 schemas used, 1 for the SandwichAPI, 1 for the SandwichOrderAPI).
At least the sandwiches, abispersons and abiscourses should be tables in Oracle.

GROUPS and DB USERS:

*Group 1: Dirk and Luis
  DB: tu0003a and tu0003b

*Group 2: Anindiyo, Bruno and Jaouad
  DB: tu0003c and tu0003d
